

IPRO Wordle Project

MVP Development based on Henrik Kniberg – “Making Sense of MVP”

Introduction

This project was developed using Henrik Kniberg’s “**Making Sense of MVP**” methodology. Instead of first building isolated technical components, each week I implemented the earliest usable version of the product, which was gradually extended and improved.

Each development phase corresponds to a symbolic stage:

—

Week 1 — Skateboard 🛹 (Foundation)

- Created a helper tool to process the word data
- Generated a cleaned five-letter word dictionary
- Established the technical foundation for the game logic

Outcome: Data foundation prepared for the game.

—

Week 2 — Scooter 🛴 (Logic MVP)

- Implemented the complete Wordle game logic in Java
- Developed a playable command-line version
- The game was already fully playable, even without a graphical interface

Outcome: First playable MVP.

—

Week 3 — Bicycle 🚲 (Web Integration)

- Developed a browser-based interface
- Connected frontend and backend using Javalin
- Managed dependencies using Maven

Outcome: Web-based playable version.

—

Week 4 — Motorcycle 🏍️ (UX and Structure)

- Introduced SCSS for more structured styling
- Separated HTML, JavaScript, and styling files for better maintainability
- Improved usability based on testing and feedback

Outcome: Improved usability and cleaner code architecture.

—

Week 5 — Car 🚗 (Final Stage)

- Cleaned the project structure
- Documented all development steps in GitHub Issues and Wiki
- Prepared presentation and final submission

Outcome: Fully documented and presentation-ready project.

—

Conclusion

This MVP-driven approach ensured that:

- a playable version existed early in development
- each week delivered measurable user value
- the final product evolved through continuous iteration
